

BLOCH'S THEOREM

Lemma 0.1. *Let f be analytic in $\Delta = \{|z| < 1\}$ with $f(0) = 0$ and $f'(0) = 1$. If $|f(z)| \leq M$ for all $z \in \Delta$, then $f(\Delta)$ contains the disk $|w| \leq (\sqrt{M+1} - \sqrt{M})^2$.*

Proof. By Schwartz's lemma, we implicitly have $M \geq 1$. Let $f(z) = z + \sum_{n=2}^{\infty} a_n z^n$. Using CIF, we have $|a_n| \leq M$ for all n . Therefore,

$$(0.1) \quad \begin{aligned} |f(z)| &\geq |z| - \sum_{n=2}^{\infty} |a_n| |z|^n \\ &= r - \frac{Mr^2}{1-r} \end{aligned}$$

for $|z| = r < 1$. Obviously, we can maximize the RHS of (0.1) by taking

$$(0.2) \quad r = \rho = 1 - \sqrt{\frac{M}{M+1}}$$

and correspondingly, $|f(z)| \geq (\sqrt{M+1} - \sqrt{M})^2$ for $|z| = \rho$.

For all $|w| < (\sqrt{M+1} - \sqrt{M})^2$, $|f(z) - (f(z) - w)| = |w| \leq |f(z)|$ for all $|z| = \rho$. Therefore, $f(z) - w$ and $f(z)$ have the same number of zeros in $|z| < \rho$. It follows that $f(\Delta)$ contains the disk $|w| \leq (\sqrt{M+1} - \sqrt{M})^2$. \square

Obviously, by "scaling", we have the following:

Lemma 0.2. *Let f be an analytic function on $D = \{|z - a| < R\}$. If $|f(z) - f(a)| \leq M$ for all $z \in D$, then $f(D)$ contains the disk $|w - f(a)| \leq (\sqrt{M + |f'(a)R|} - \sqrt{M})^2$.*

Lemma 0.3. *An analytic function $f(z)$ on Δ is 1-1 if $|f'(z) - M| < |M|$ for all $z \in \Delta$ and a constant $M \in \mathbb{C}$.*

Proof. Let z_1 and z_2 be two distinct points in Δ and let γ be the line joining z_1 and z_2 . Then

$$(0.3) \quad \begin{aligned} |f(z_1) - f(z_2)| &= \left| \int_{\gamma} f'(z) dz \right| \\ &= \left| \int_{\gamma} M - (M - f'(z)) dz \right| \\ &\geq \left| \int_{\gamma} M dz \right| - \left| \int_{\gamma} (f'(z) - M) dz \right| \\ &\geq |M| \int_{\gamma} |dz| - \int_{\gamma} |f'(z) - M| |dz| > 0 \end{aligned}$$

and hence $f(z)$ is 1-1. Note: the third line is triangle inequality. \square

Theorem 0.4 (Bloch's Theorem). *Let $f(z)$ be an analytic function on Δ satisfying $f'(0) = 1$. Then there is a positive constant B (called Bloch's constant), independent of f , such that there exists a disk $S \subset \Delta$ where f is 1-1 and whose image $f(S)$ contains a disk of radius B . In particular, $B > 1/72$.*

Proof. Obviously, it is enough to show this for $f'(z)$ bounded on Δ .

Let

$$(0.4) \quad m(r, g) = \max_{|z|=r} |g(z)|.$$

We let $0 \leq r_0 < 1$ be the largest number ¹ such that $(1 - r_0)m(r_0, f') = 1$. Such r_0 exists since $f'(z)$ is bounded on Δ .

Then $(1 - r)m(r, f') < 1$ for $r > r_0$ and hence

$$(0.5) \quad |f'(z)| \leq \frac{1}{1 - |z|}$$

for $|z| \geq r_0$. And by principle of maximum modulus, we have

$$(0.6) \quad |f'(z)| \leq m(r_0, f') = \frac{1}{1 - r_0}$$

for $|z| \leq r_0$. In conclusion,

$$(0.7) \quad |f'(z)| \leq \frac{1}{1 - \max(r_0, |z|)}$$

for all $z \in \Delta$.

Let $a \in \Delta$ be a number such that $|a| = r_0$ and $|f'(a)| = 1/(1 - r_0)$.

For $0 < \rho < 1 - r_0$ and $|z - a| \leq \rho$, we have

$$(0.8) \quad |f'(z) - f'(a)| \leq \frac{1}{1 - r_0} + \frac{1}{1 - r_0 - \rho}$$

and hence

$$(0.9) \quad |f'(z) - f'(a)| \leq \frac{|z - a|}{\rho} \left(\frac{1}{1 - r_0} + \frac{1}{1 - r_0 - \rho} \right)$$

by Schwartz's lemma ². Therefore, $|f'(z) - f'(a)| < |f'(a)|$ for z in the disk

$$(0.10) \quad S = \left\{ |z - a| < \frac{\rho(1 - r_0 - \rho)}{2(1 - r_0) - \rho} \right\}.$$

The radius of S is founded by solving for $f'(a) > \text{RHS 0.10}$.

By Lemma 0.3, f is 1-1 on S . Obviously, the radius of S is maximized when we set $\rho = (2 - \sqrt{2})(1 - r_0)$ and correspondingly,

$$(0.11) \quad S = \left\{ |z - a| < (3 - 2\sqrt{2})(1 - r_0) \right\}.$$

¹Here Xi Chen defined using max, but I think sup would be more accurate.

²See the end of the note.

Moreover, since

$$(0.12) \quad |f(z) - f(a)| \leq \ln \left(\frac{\sqrt{2} + 1}{2} \right)$$

for $z \in S$ by (0.7), we conclude that $f(S)$ contains a disk of radius

$$(0.13) \quad \left(\sqrt{\ln \left(\frac{\sqrt{2} + 1}{2} \right)} + (3 - 2\sqrt{2}) - \sqrt{\ln \left(\frac{\sqrt{2} + 1}{2} \right)} \right)^2 > \frac{1}{72}.$$

□

Remark 0.5. The key to the proof of Bloch's theorem is the existence of $a \in \Delta$ and positive constants C_1 and C_2 such that $|f'(z)| \leq C_2|f'(a)|$ for all $|z - a| \leq C_1/|f'(a)|$.

Supplementary notes: A variant of Schwarz's lemma

Theorem 0.6 (A variant of Schwarz's lemma). *Let $f: \{|z| \leq R\} \rightarrow \mathbb{C}$ such that $|f(z)| \leq A$ for all z and $f(0) = 0$. Then*

$$f(z) \leq \frac{A|z|}{R}$$

Proof. Let define the function $g(y) := \frac{f(Ay)}{R}$. Then clearly $g: \Delta \rightarrow \Delta$ and satisfying $g(0) = 0$. By the usual Schwarz's lemma, we must have $|g(y)| \leq |y|$. Change $y \rightarrow \frac{z}{R}$, we get the desired inequality. □
